DOCKER CHEAT SHEET

Docker

Docker tool was introduced in order to make it easier for you to create, deploy, and run applications using containers. Containers provide you the packaging of your application with all the important components it requires, like libraries and other dependencies, and ship them all out as one package. Due to this, you as a developer can be assured that your application will run on any other machine.

Docker Architecture

- Registry hosts the public and official images
 Images can be downloaded from the registry directly or implicitly when starting a container
- ners instances of images. Multiple containers for a single image is
- cker daemon creating, running and monitoring containers, building and storing images
 • Client - talks to daemon via http

Orchestrate

Commands:

- To initialize swarm mode and listen to a specific interface:
 - Docker swarm init --advertise-addr 10.1.0.2
- Docker swarm join --token<manager-token> 10.1.0.2:2377
- Docker swarm join --token<worker-token> 10.1.0.2:2377
 - Docker node Is

- a service from an image and deploy 3 instances:

 Docker service create --replicas 3 -p 80:80 name -webngix
- List ser
- Docker service Is Scale a
- Docker service scale web=5
- List tasks
 - Docker service ps web

Build

- To build the imag ge from the docker file and tag it:
 - Docker build -t myapp :1.0
- Docker images
- an image from the docker store: Docker rmi alpine: 3.4

■ To create and run a command:

- Docker run --name container_name docker_image
- -d detach container on start

 - -m remove container once it stops
 -p publish host ip and host port to the container por
 -v define and share volume across containers
 -read-only sets it to read only permission

- To pull an image from the registry:
- Docker pull alpine: 3.4.
- Retag a local image with a new image
- Docker tag alpine:3.4 my/apo/

myalpine:3.4

Log in to

ocker legin my.regis.

■ Push an image to a registry:

- Dockst push myrepo/ myalpine.5.4

Clean Up

■ To clean up unused/dangling images:

Docker image prune

■ To remove images not used in containers:

Docker image prune -a

■ To prune the entire system:

Docker system prune

■ To leave a swarm:

Docker swarm leave

■ To remove a swarm:

Docker stack rm stack_name

■ To kill all running containers:

Docker kill \$ (docker ps -q)

■ To delete all stopped containers:

docker rm \$(docker ps -a -q)

■ To delete all images:

docker rmi \$(docker images -q)

Services

List of all services running in a swarm

Docker service Is

To see all running services:

Docker stack services stack_name

To see all service logs

Docker service logs stack_name service_names

To scale service across quantied nodes

Docker service scale stack_name_service_name= replicas

Interaction Within a Container

Run a summard in the

Docker exe -ti container_name command.sh

Follow the container logs:

Docker logs -ft container name

Save a running container as an image:

Docker commit -m "commit message" -a "author" container_name username/image_name: tag

Important Terms

- Layer read-only files to provision the system
- Image a read only layer that is the base of the image
- Container a runnable instance of the image
- Registry/hub the central place where images live

USE 5

- Docker machine a VM to run docker containers
- Docker compose a VM to run multiple containers as a system
